Project in Ubuntu: Video Editing with Shotcut

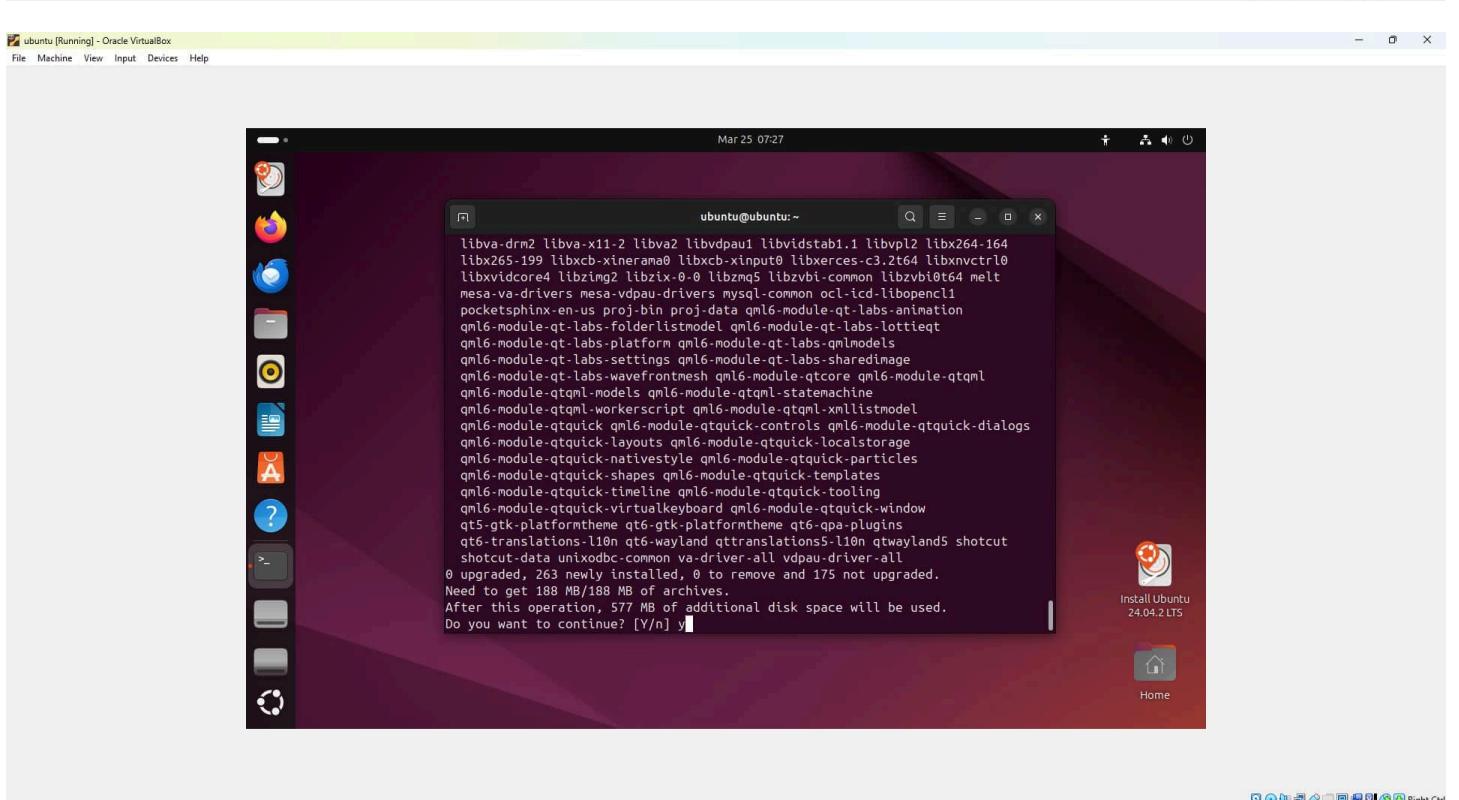

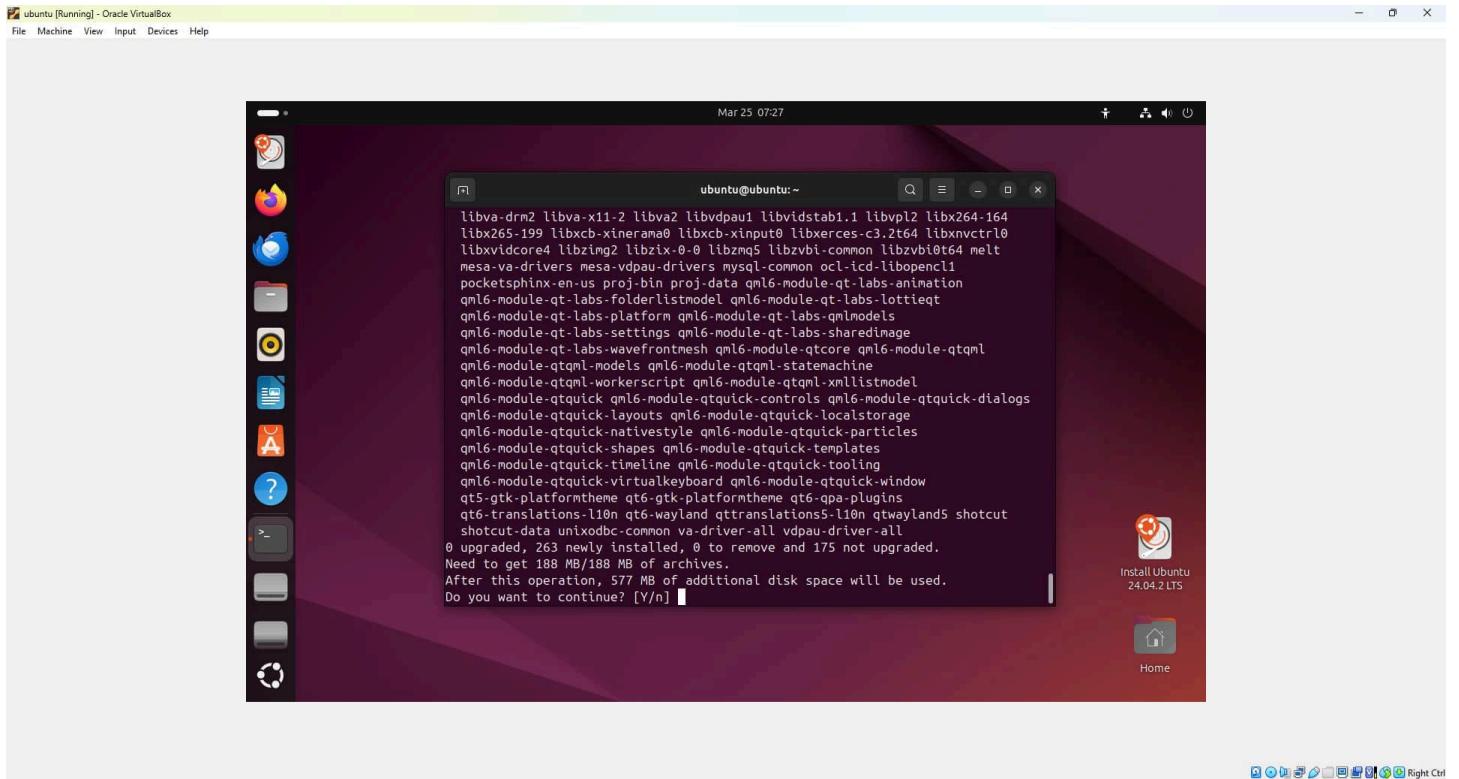

This project documents the process of manually installing **Shotcut** on **Ubuntu** using terminal and creating a **product advertisement video** for a cap. Below is the step by step explanation for entire workflow, from installation to exporting the final video.

- Updating The System

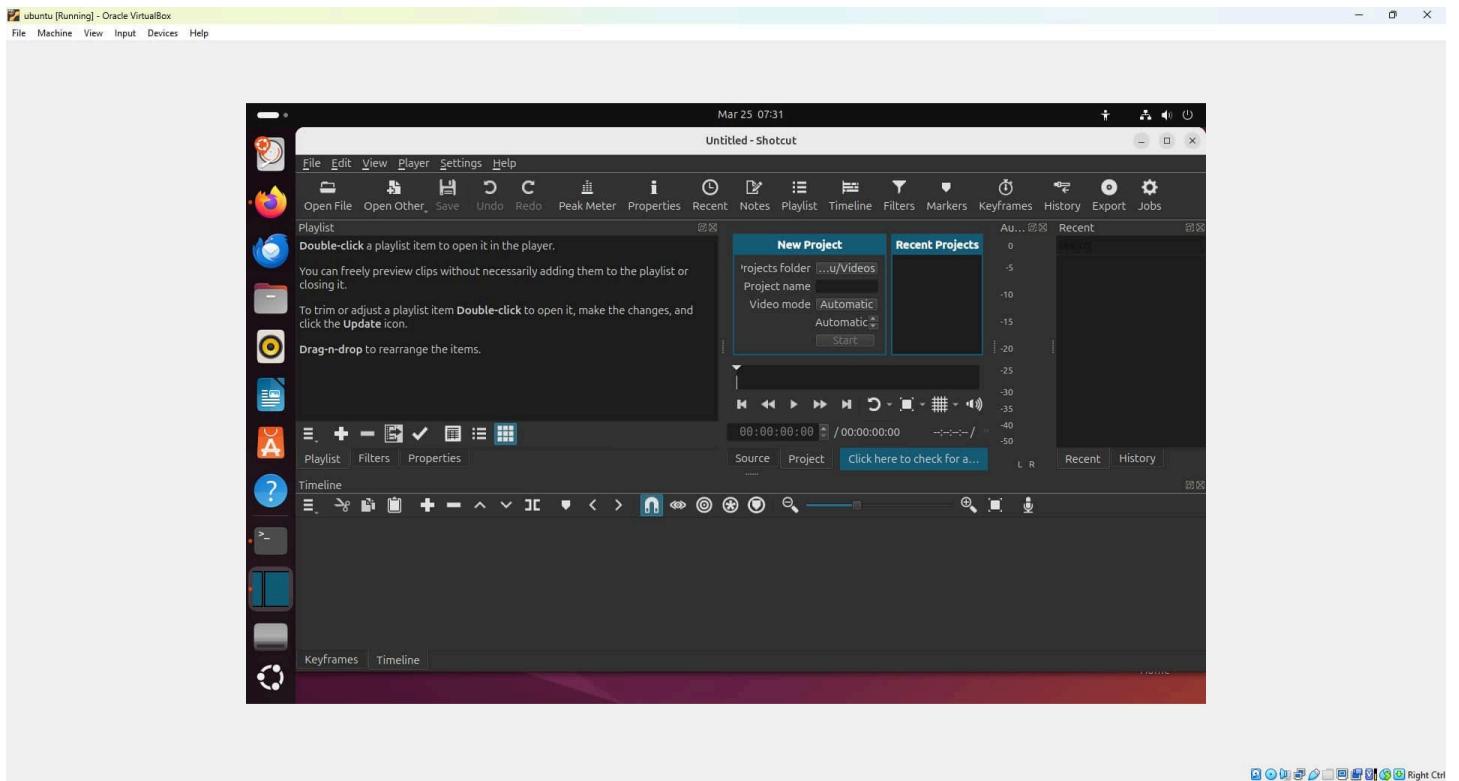

I opened the terminal and ran update command to ensure my system is up to date before installing **Shotcut**.

I manually installed **Shotcut** using the command line. When prompted, I typed "y" to confirm the installation

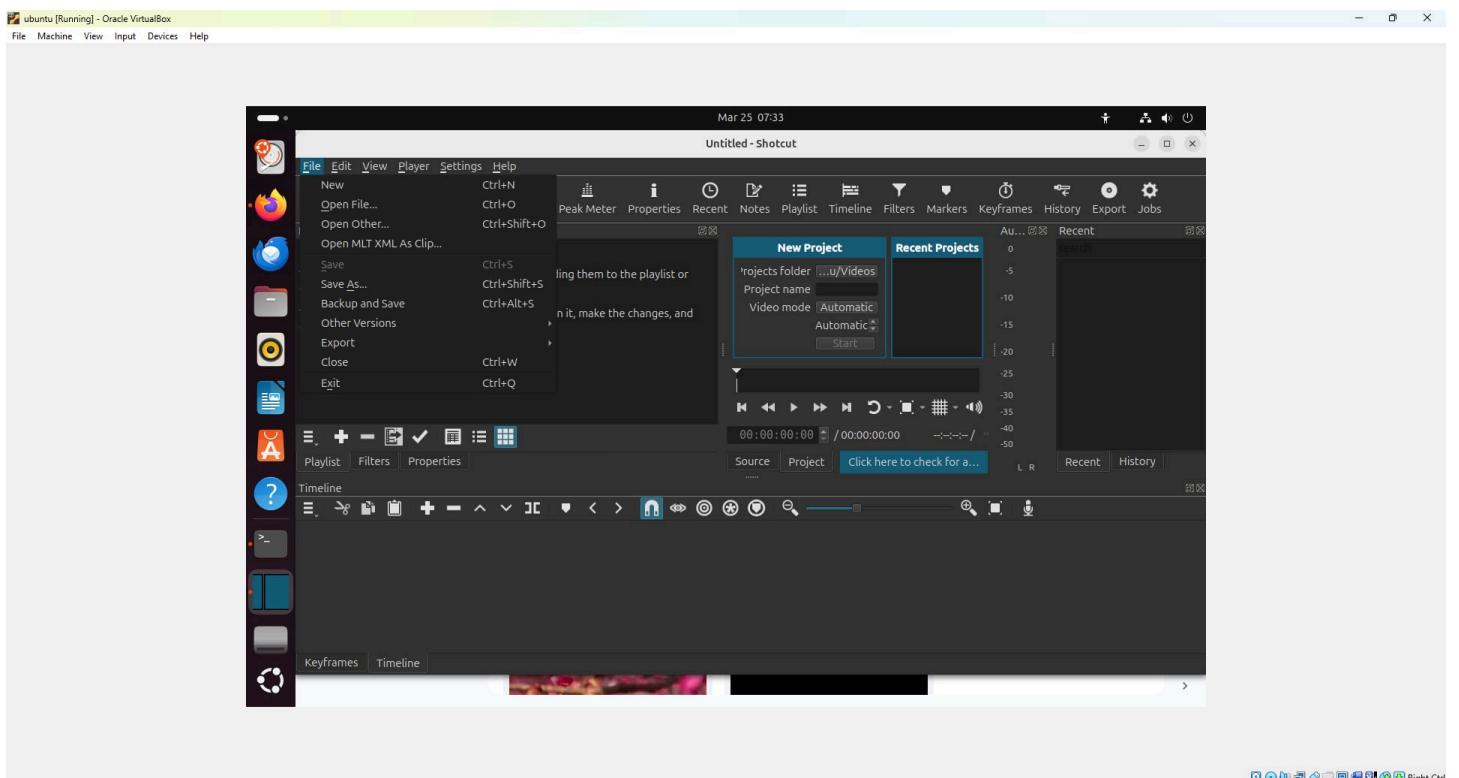

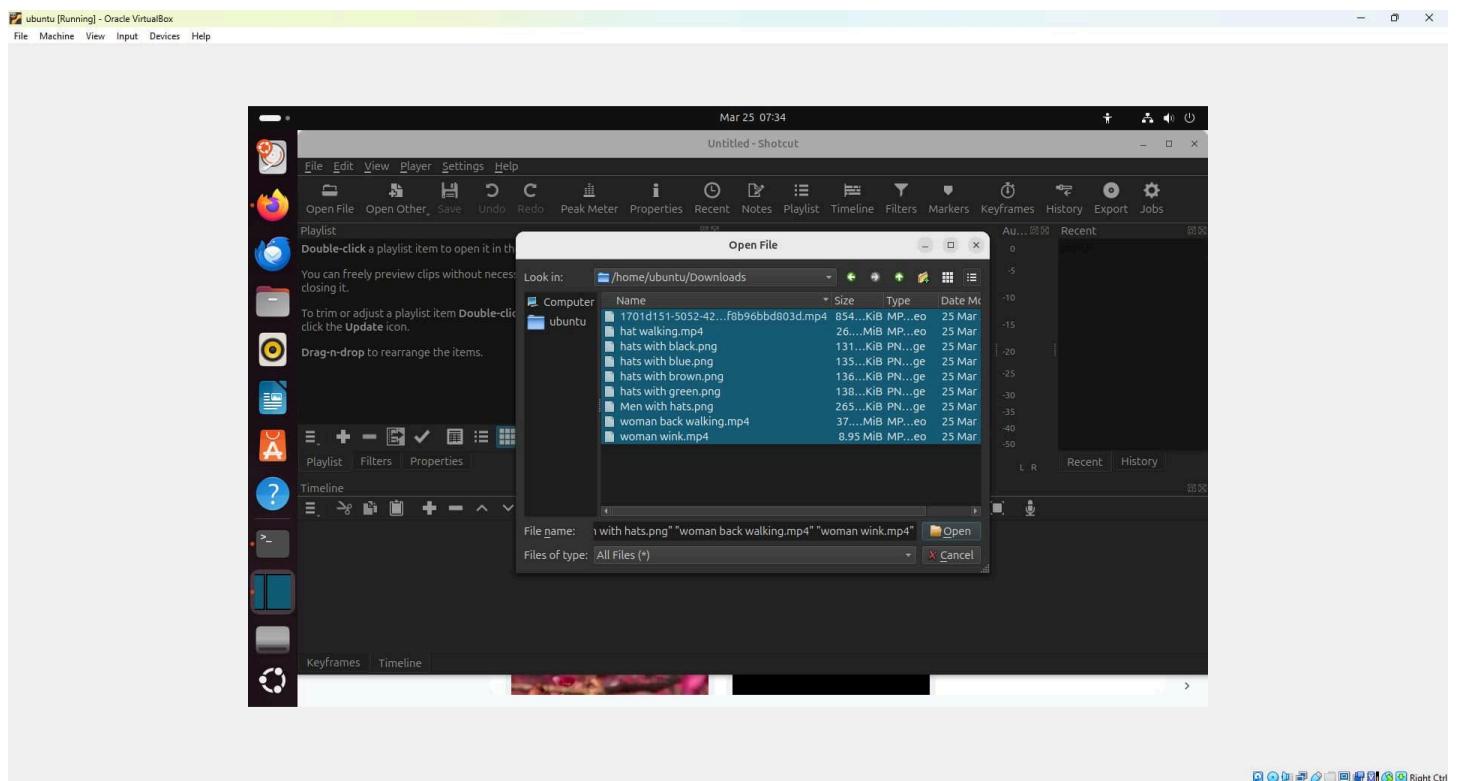

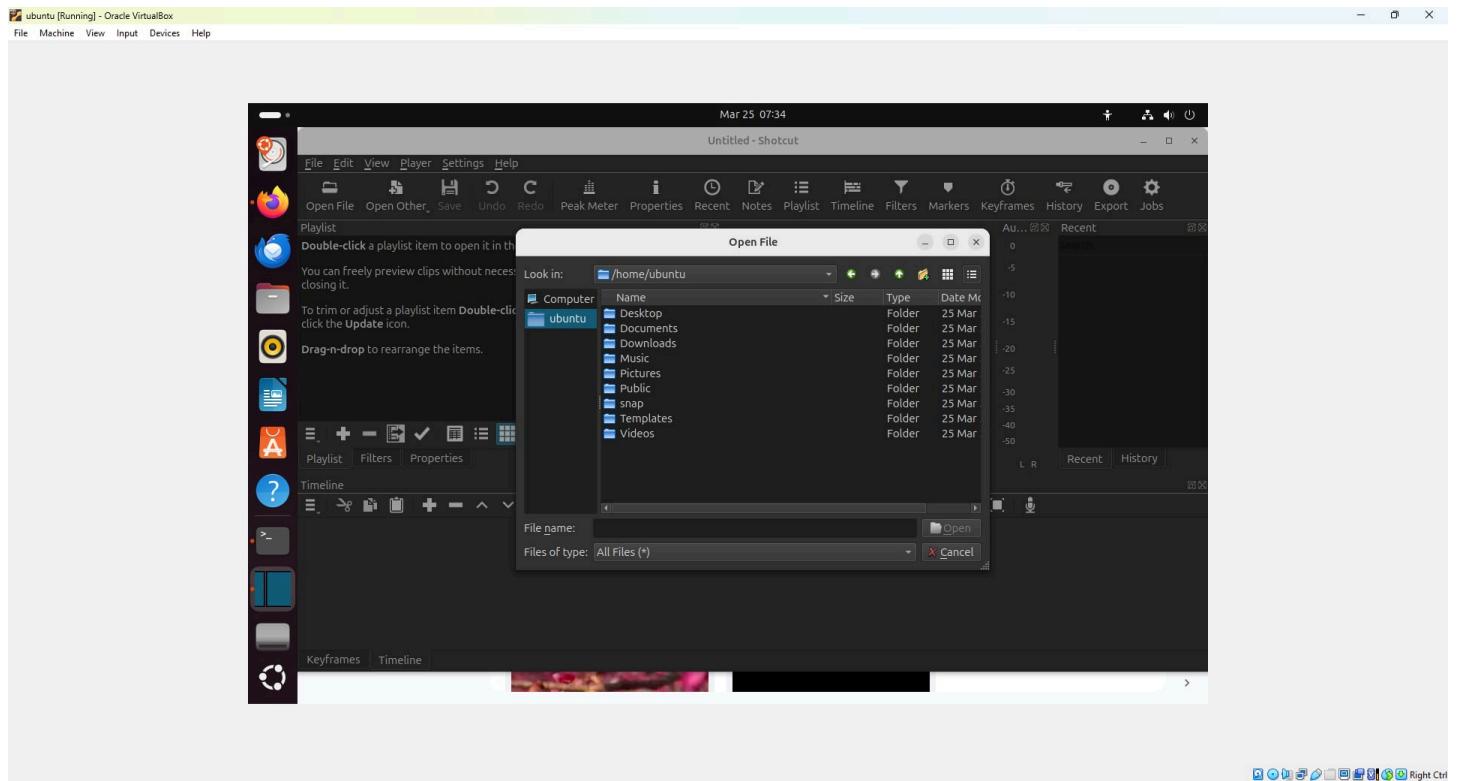

I launched **Shotcut** by typing **shotcut** in the terminal after installation.

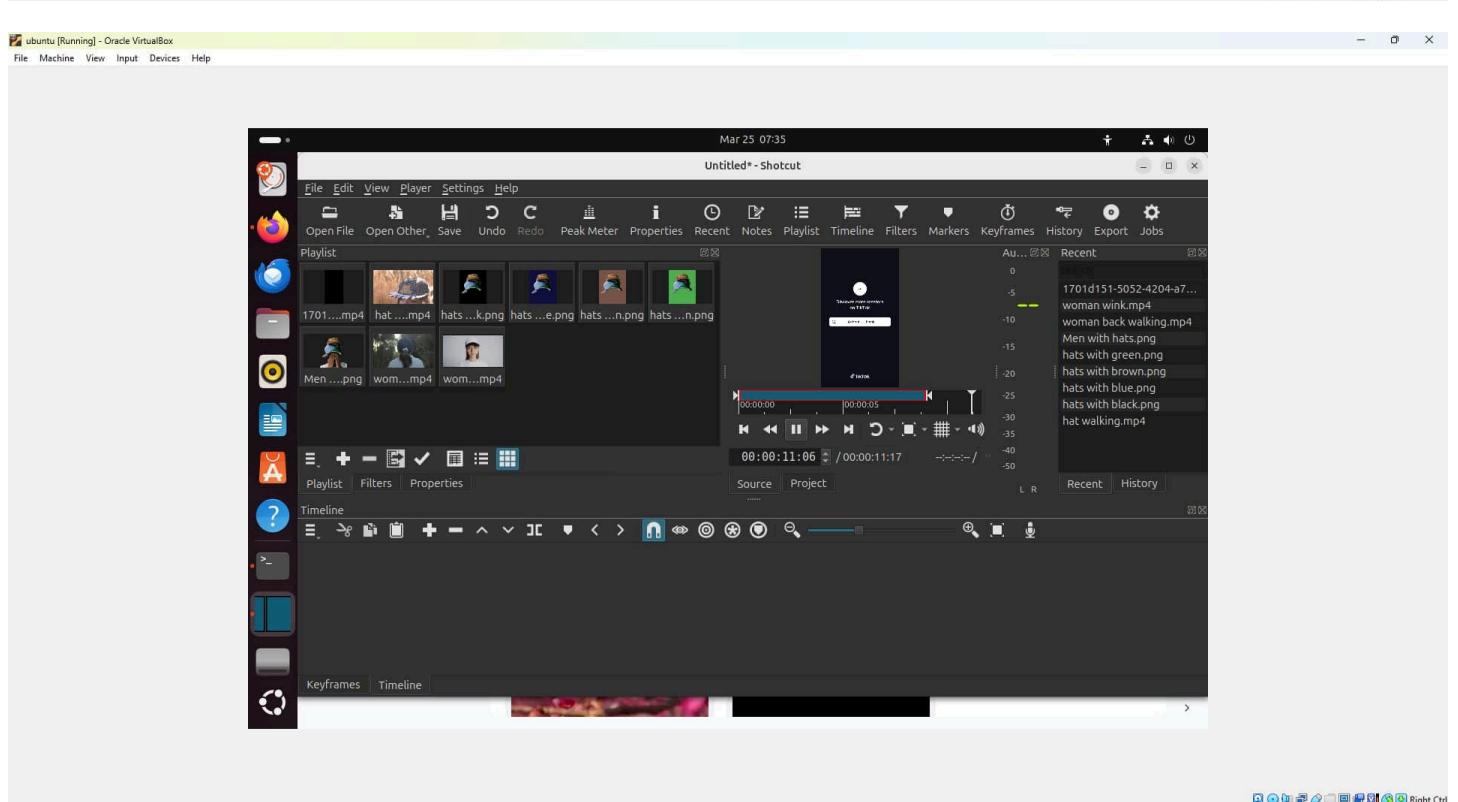

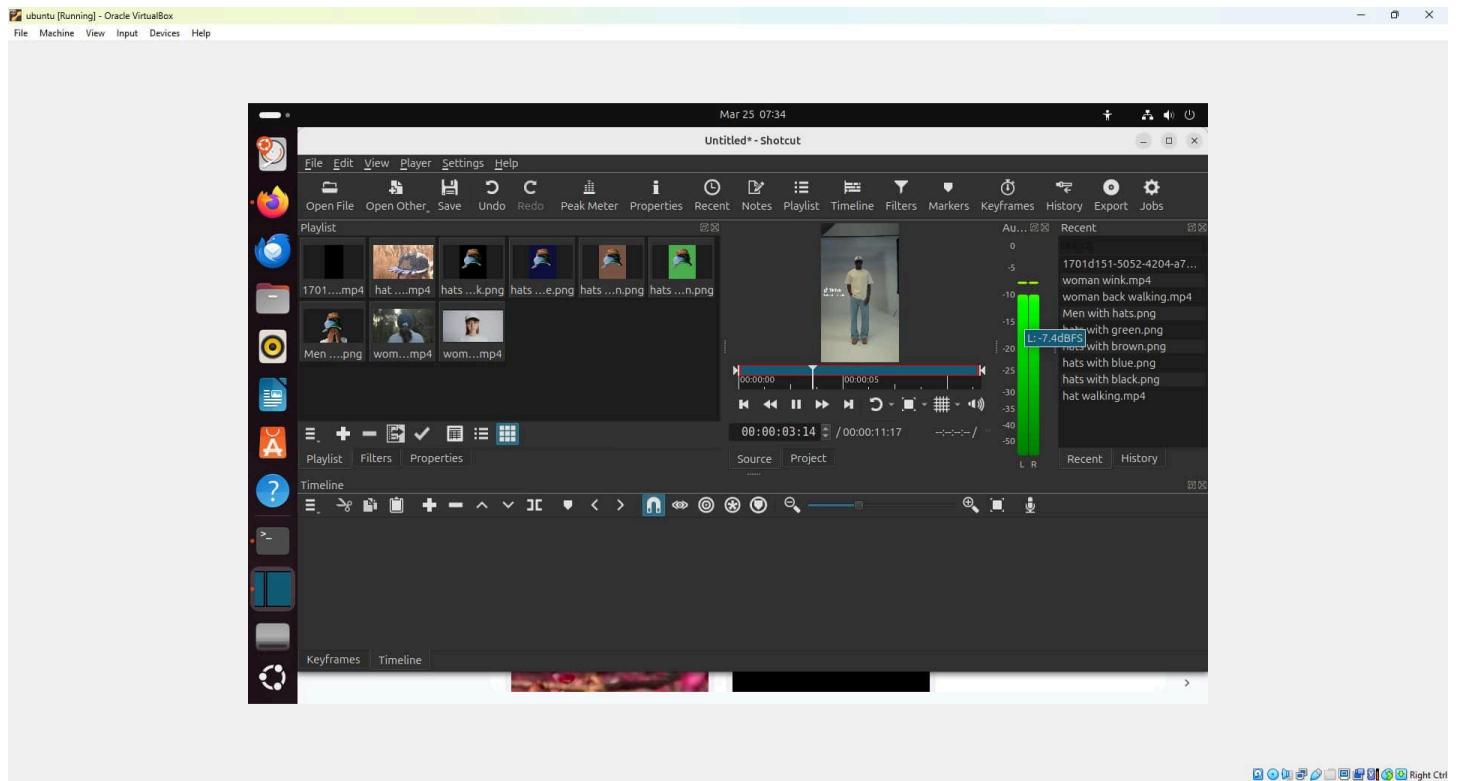

- **Editing Process**

To import the video clips and images downloaded from Google Drive, I navigated to File > Open File, selected the Downloads folder, and imported the desired media.

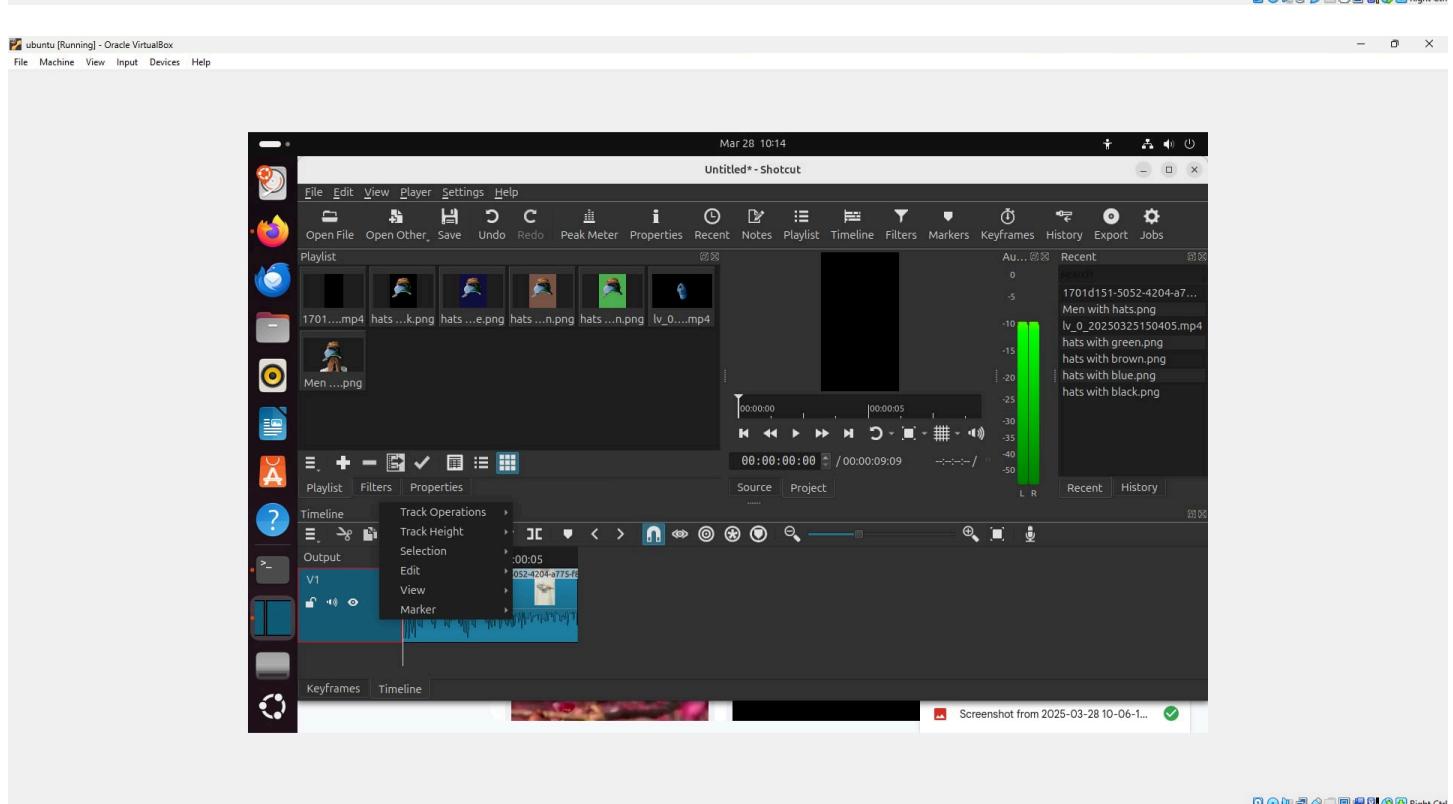

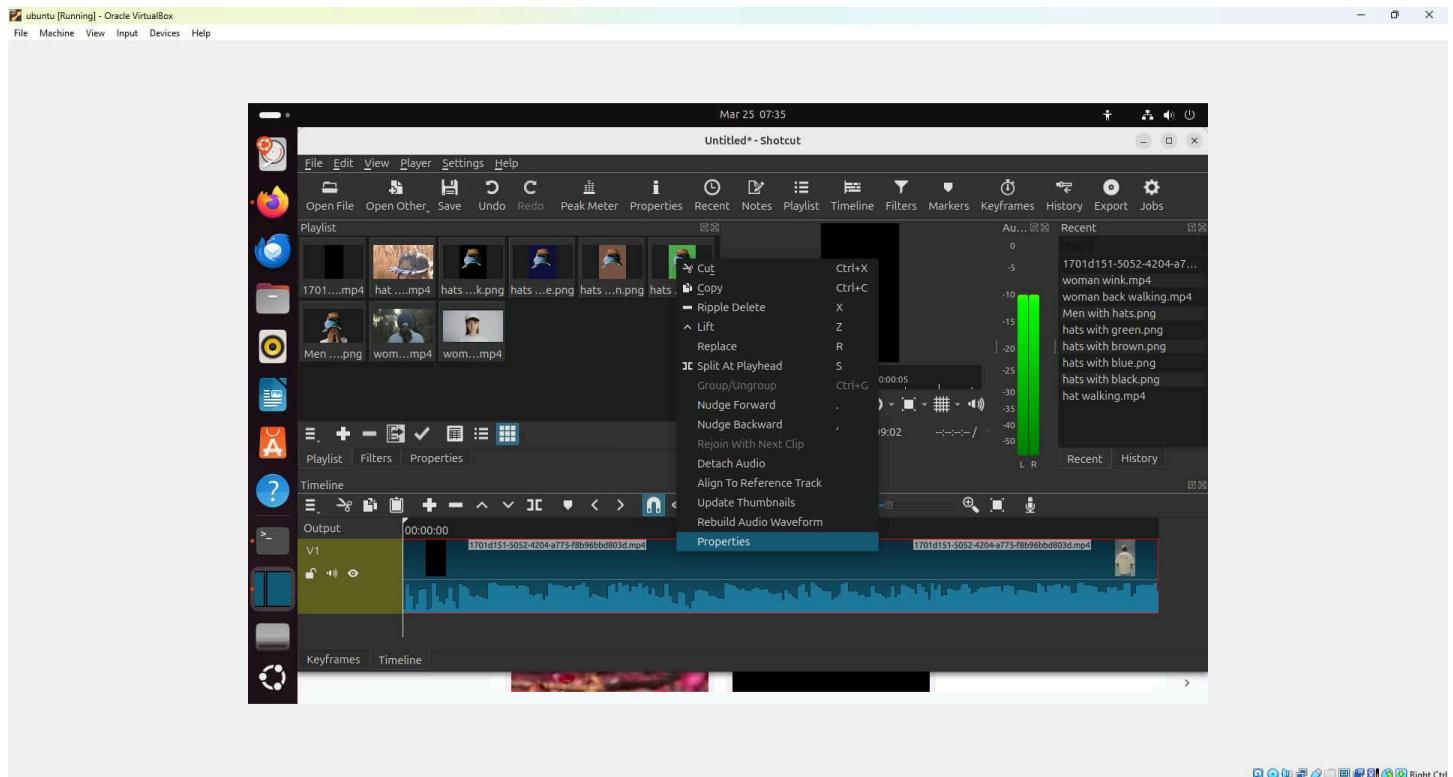

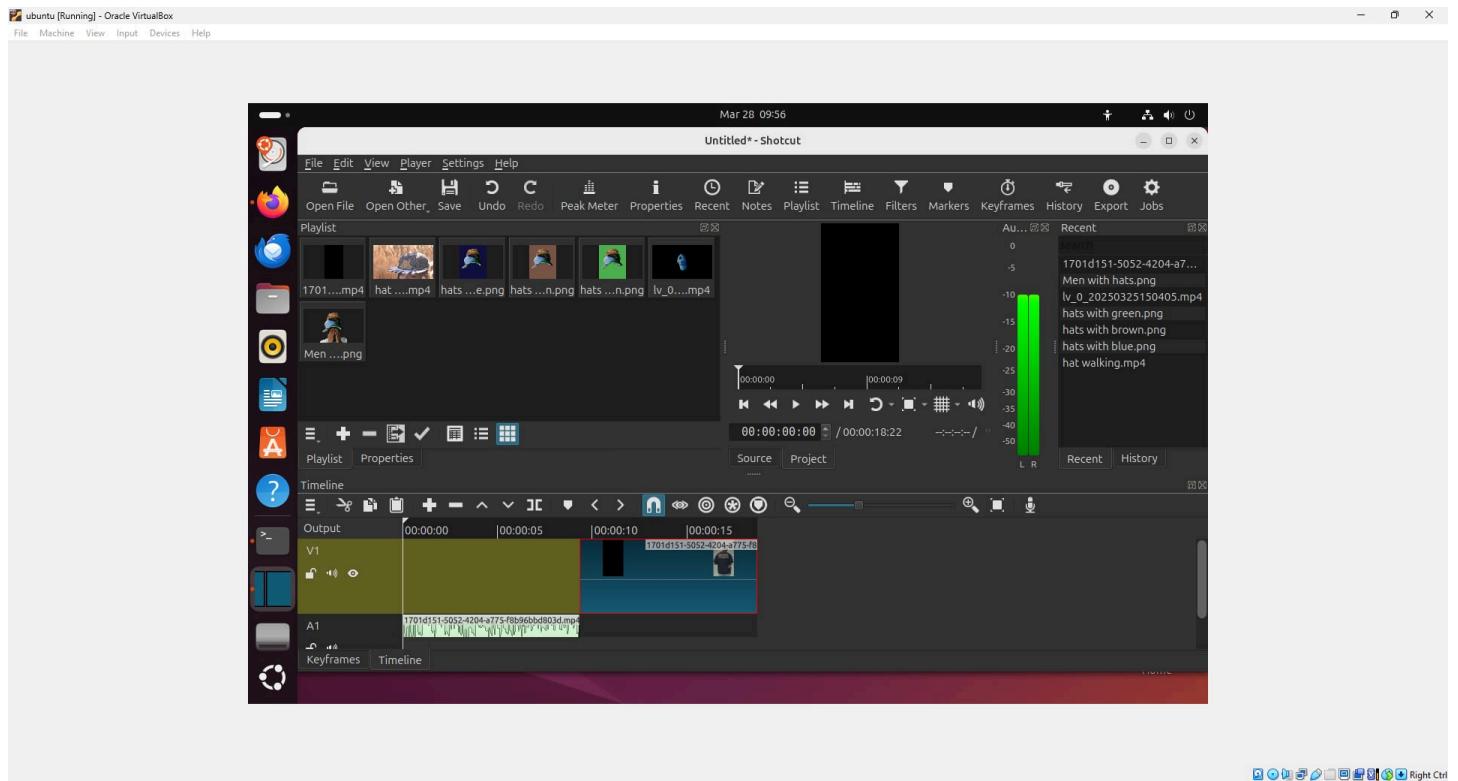

I added the suitable clip to the timeline using the editing tools to cut and adjust the clips.

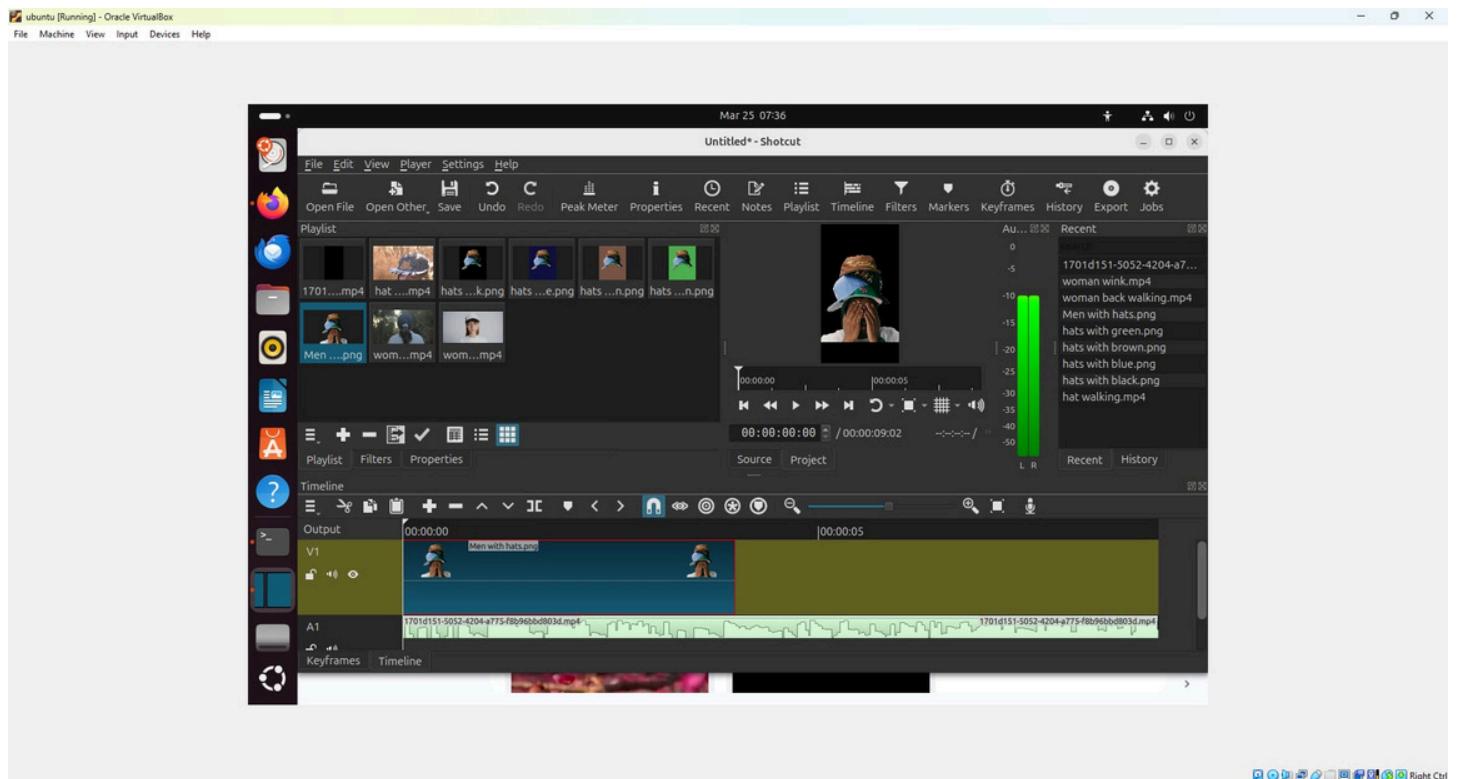

I then built the video sequence by dragging the clip into the output, and right-clicked it to explore editing options.

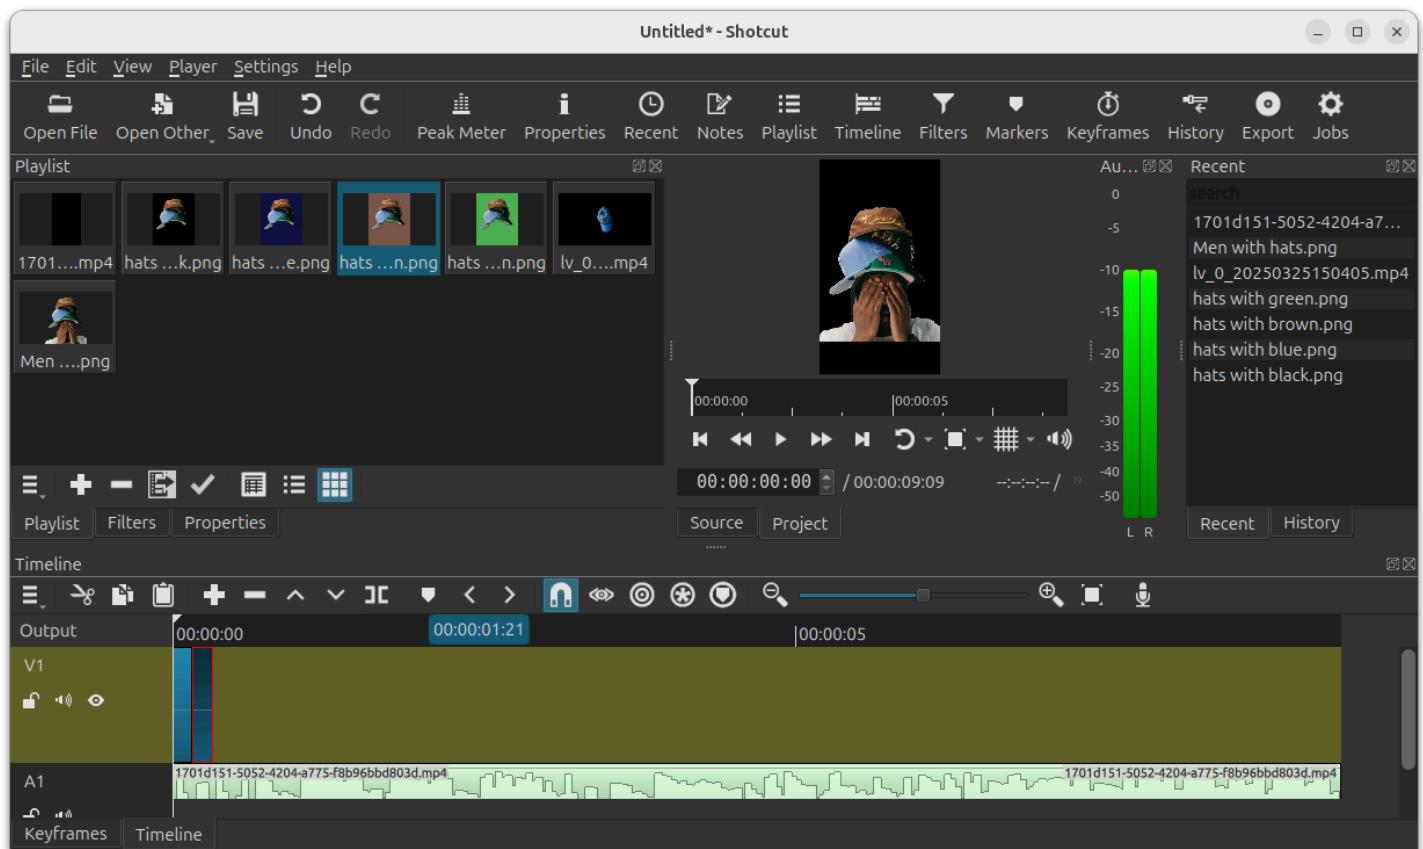

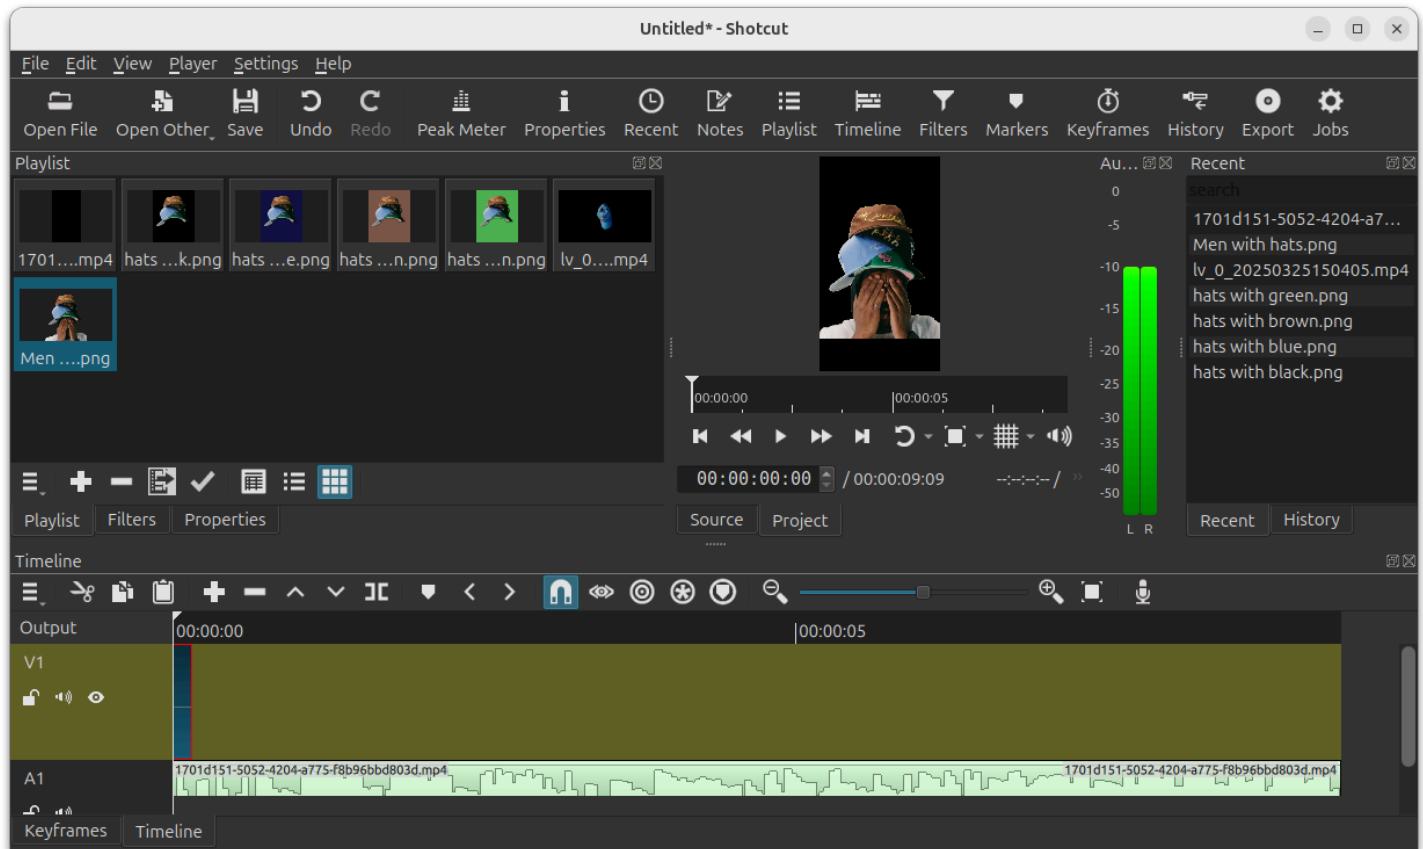

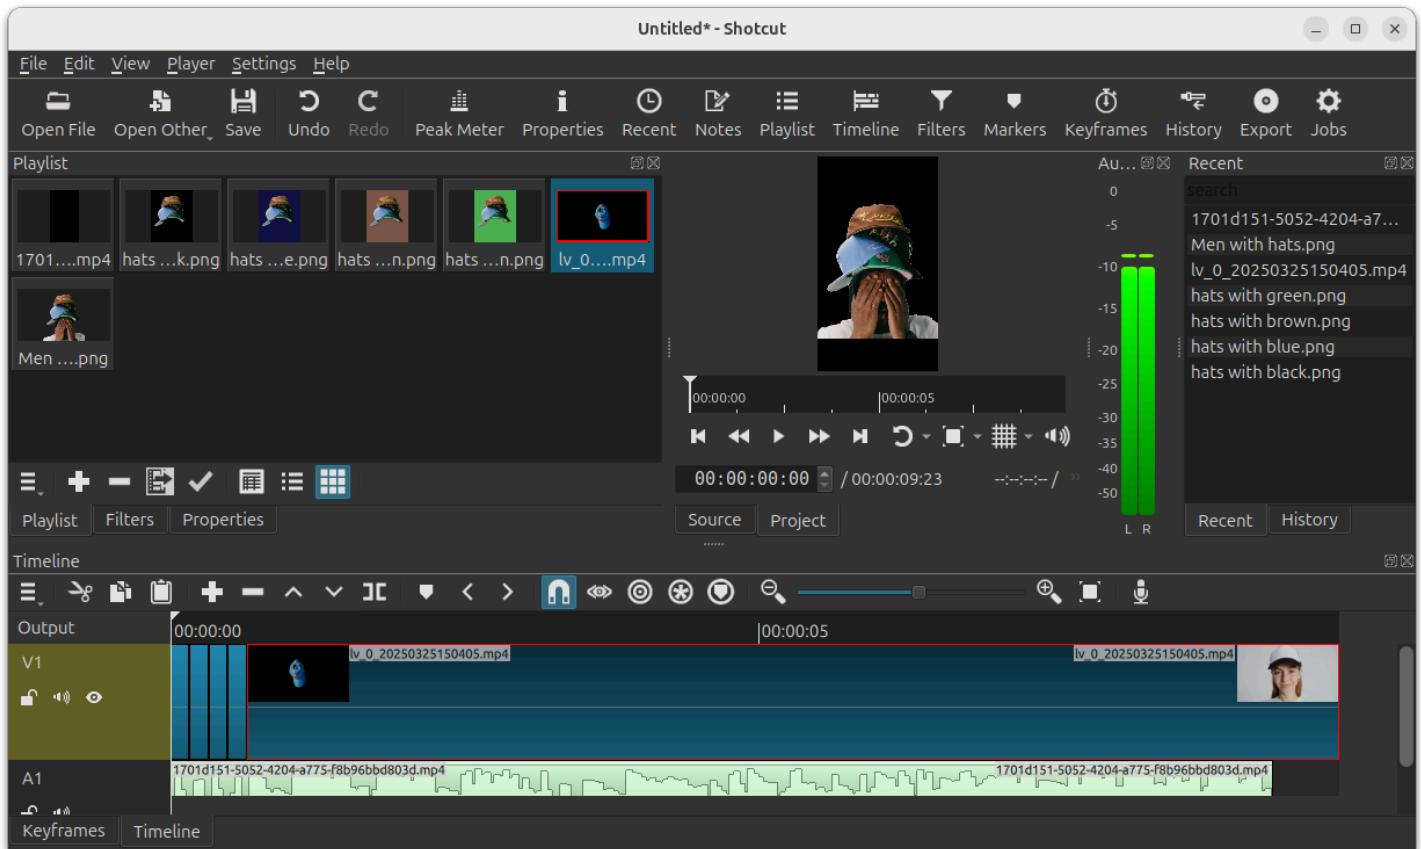

In this case I chose “Detach Audio” to separated the clip as background music and placed it in the audio track while other clips in the video track.

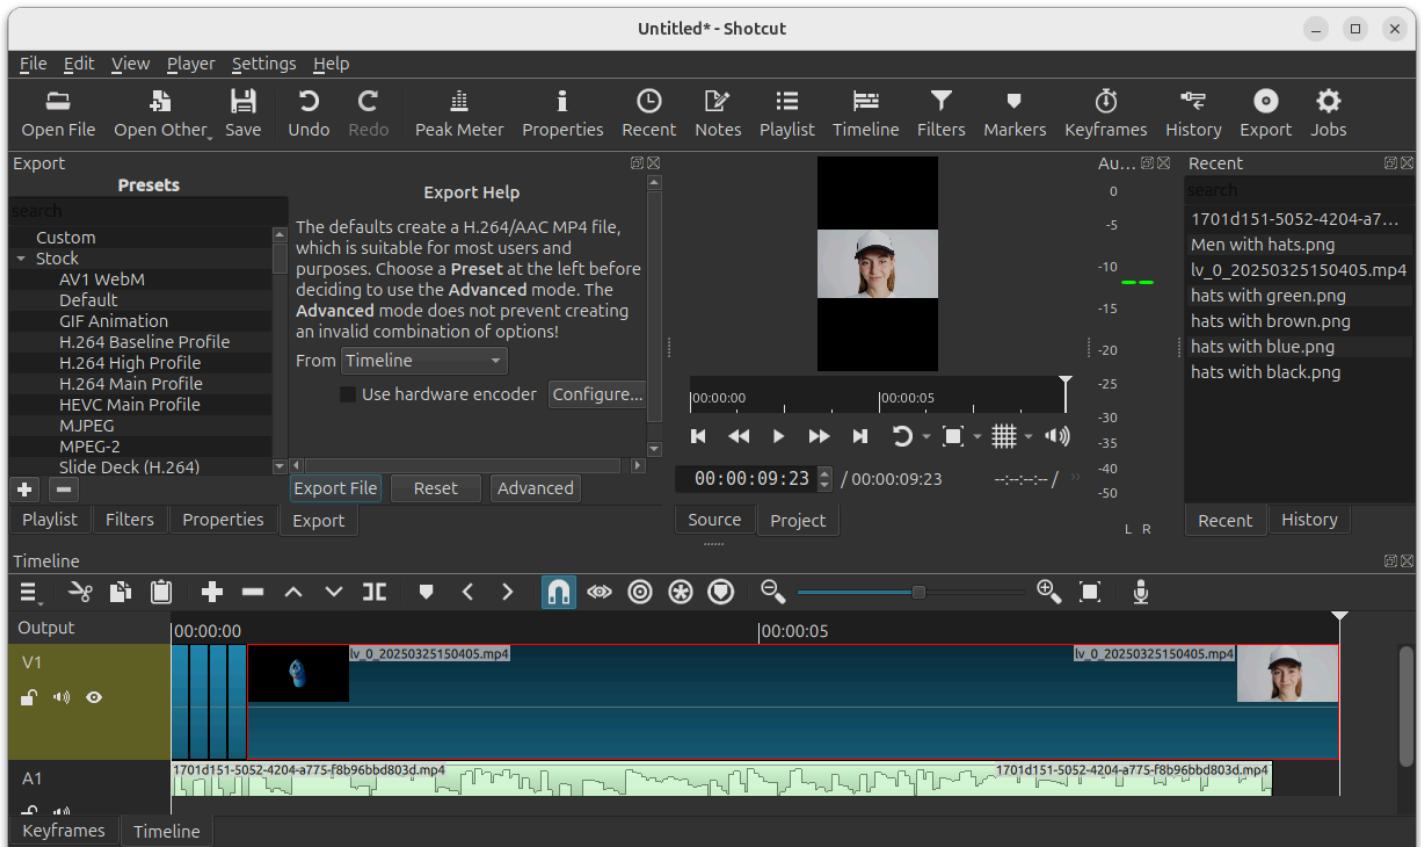

The video and soundtrack were separated, then edited and adjusted until I was satisfied with the final product.

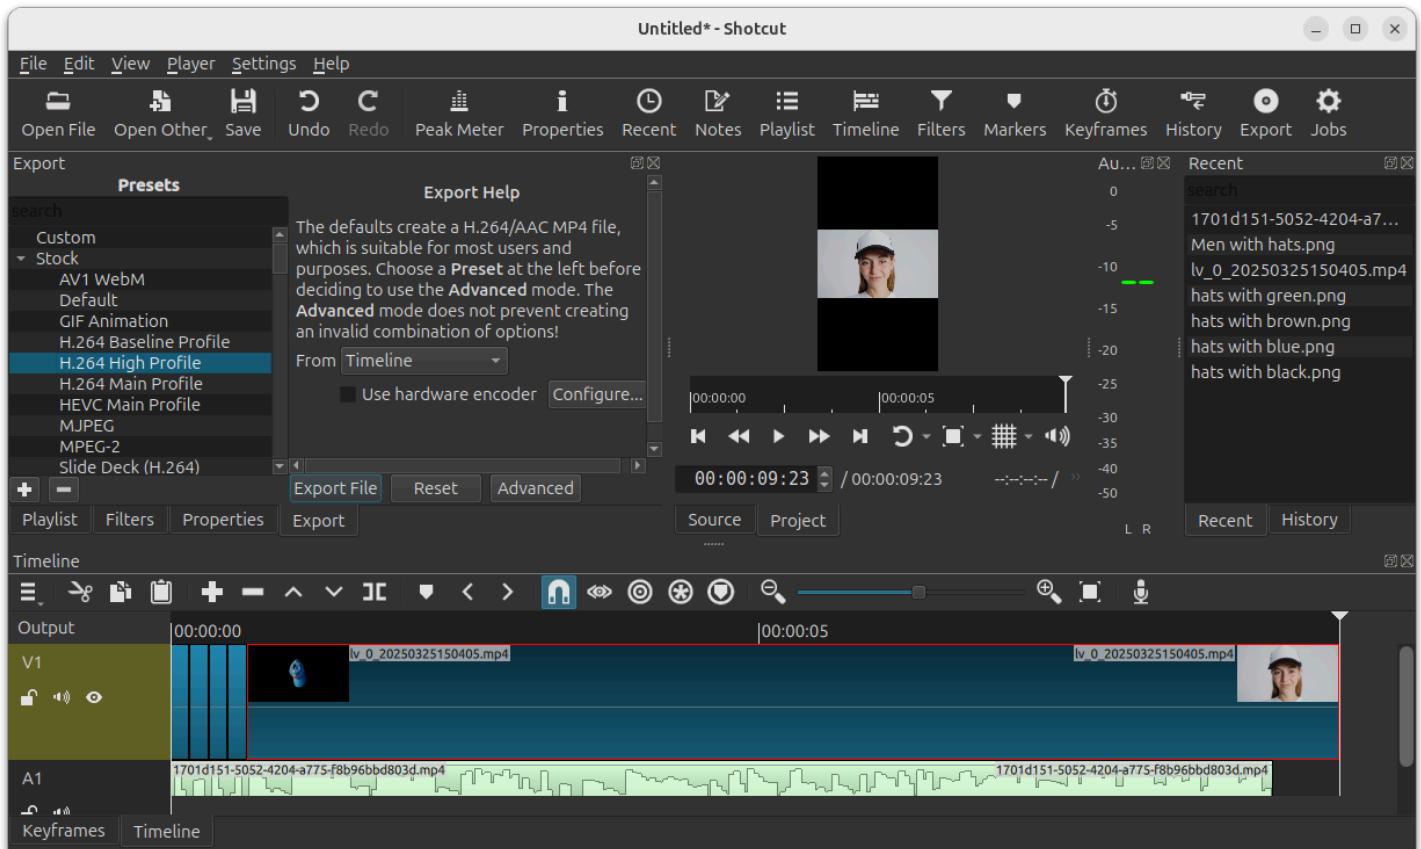

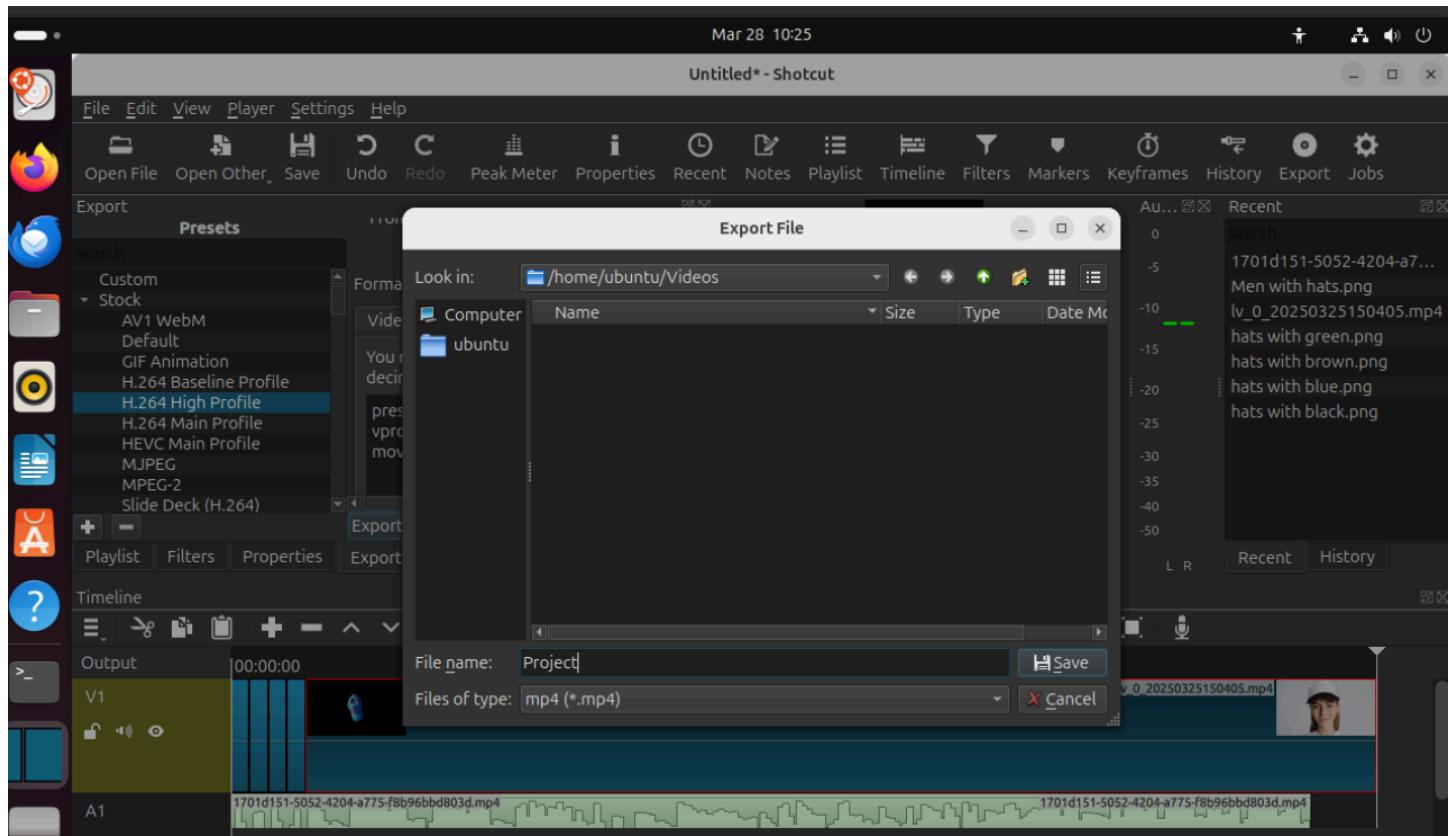

Reviewed the full video to ensure smooth transitions and proper synchronization. Clicked “Export” to render the final project

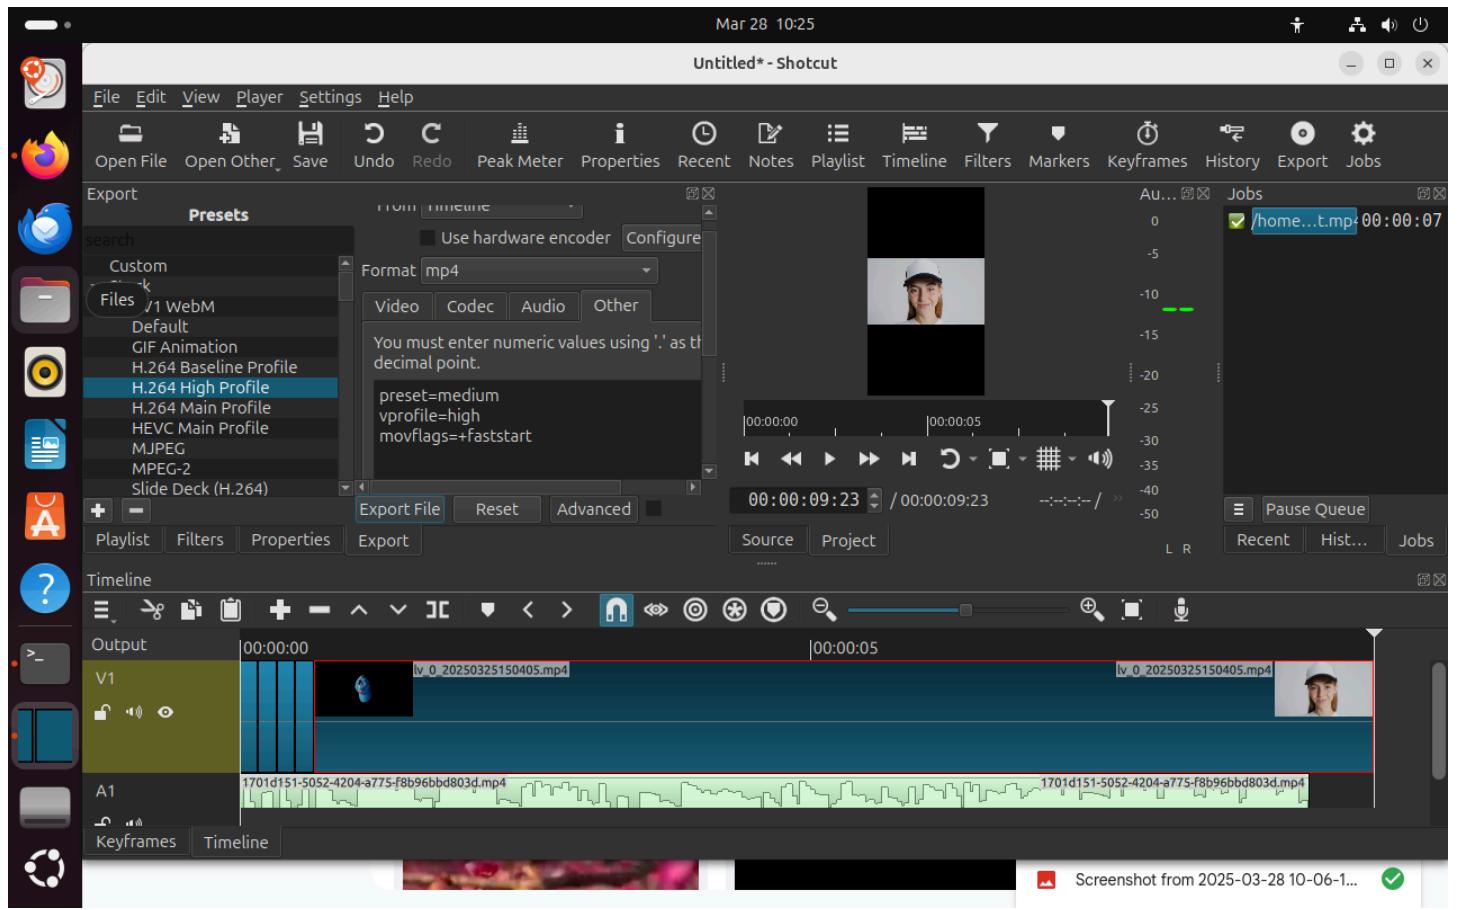

Select a suitable video format.

Set the file name & location

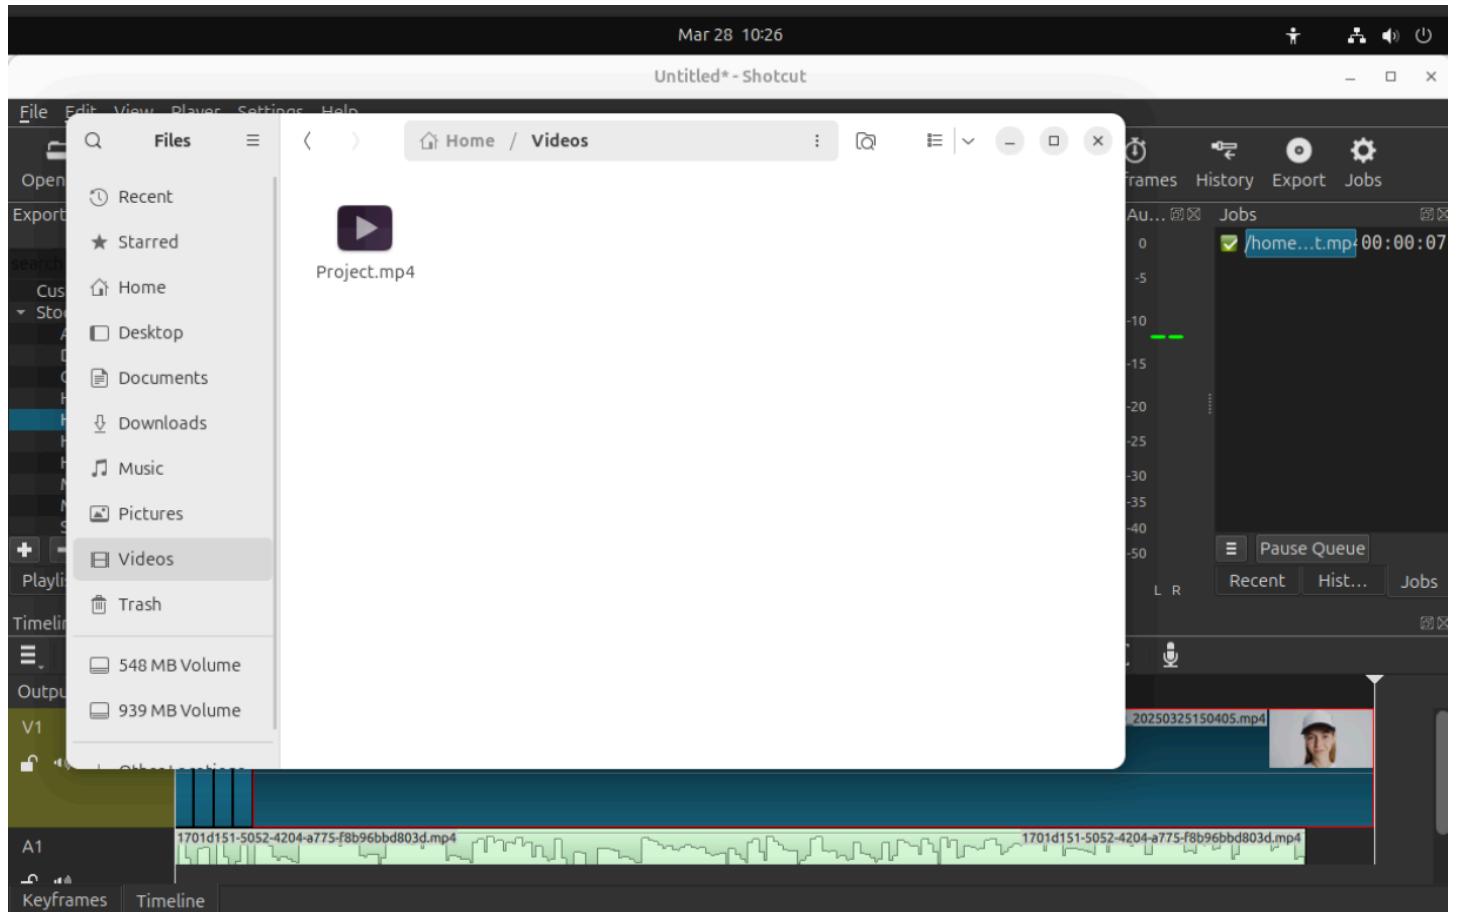

Wait for the export to finish, which is in “Jobs” you can see it’s on progress.

- Check the exported file

Open the file in File Manager to verify it's working.

This project showcase my video editing skills using **Shotcut**, from manual installation to creating a polished cap product advertisement. It reflects my creativity and technical expertise, now my part of my portfolio.

WHY “Shotcut”?

It's free, powerful, and easy to use, making it perfect for both beginners and professionals. It supports multiple formats, offers advanced editing tools, and doesn't require a high-end system. It's also great choice for anyone looking reliable video editor without a subscription.
